

Project proposal

Purpose and audience of the project

The purpose of the project is to design, build and test and website for a new brand and business called “Cosy Pets”.

My project is to make online presence for the company in the form of a interface and for a brand named "Cosy Pets" which will be an information point for users to learn more about Cosy Pets, so users can effectively use the website to take their pet to the right place to experience stress-free comfort of knowing that their pets are in the right hands. I want this website to be user friendly and the interface with be intuitive so that it can be accessible to all user and various platforms including iPhone, Android, Tablet, Desktop and TV browsing, also including people who are underage, and those who require accessibility features for impaired vision, hearing limitations and their personal background. For me to manage the user requirements, I will follow “the web’s best practice guidelines” and make it easy for the users to read and not use complex words so they might struggle ending up in a loss of interest of users. Instead, I will use commonly use words that will make it accessible for the users who may find it difficult to understand. I acknowledge that some of my users will be dissimilar age groups and will have a lack of skill, so to fix this, I will use the most widely used language. As for my choice a Menu User Interface, I may also use a mega menu and try to use the website to book the services online and making it transactional with a booking form and ability to take payments. I will make sure my interface suitable for everyone as it will brand the company to a mid to premium target audience. I will choose a catchy name entitled “Cosy Pets”, so the users can instantly get the feel of what the interface is delving into.

I will create a feature to those who have a lack of skill and having issues with my interface so as a result, they will acknowledge everything said and will know what the interface is trying to say. Also, the client is the owners of the business however the real client is the end user, and my user acceptance testing must satisfy all user groups. One of the main areas of focus will be accessibility and so that the website can be auto responsive to different platform that it will be accessed on.

The interface will be designed for a range of users to increase our reach and target audience meaning it will appeal to all age groups and genders. Users will benefit from one scroll and one click to get to the relevant content. We are developing a user-friendly user interface.

Project requirements

For my project, I will have to complete the interface using the Gantt chart, and ensure the project is completed before the deadline for my assignment as the timescale is 9 weeks. As for the budget £8,500, it is fundamental to get the assets required under the budget. As for the design stage, I will have to choose my brand colours carefully and use appropriate colours from the colour pallet to match the content. Furthermore, I will deliver a good user experience and look and feel for the overall website to enhance the user to stay on the site for longer this will help my google ranking to get on page 1 of googles listing for my chosen keywords.

The Cosy Pets website will be split up into four menu headings:

- **Home Page, containing information about Cosy Pets**
- **Dog Facilities, including information**
- **Cat Facilities, including information**
- **Booking forms, Check-in form, enter owner's name and pet details**

Project Plan could also include:

Project Start

- a. **Brainstorming of ideas**
 - b. **Finalising the project scope**
-
1. **Content Creation**
 2. **Design and Prototyping using tools like Figma to design the user experience**
 3. **Development and Build**
 4. **User Acceptance Testing**
 5. **SEO (Search Engine Optimisation)**
 6. **Bug fixes and Snagging Issues**
 7. **Go Live**
 8. **Keeping the content up to date - Content Management**

Furthermore, I must attend efficient meetings with the users and the client (manager of cosy pets) to add any relevant changes so it will be up to standard and will make the users and the client more comfortable, so I can then carry on with the rest of my interface.

Lastly, I will be constructing together an info-point with 4 sections which will include the sections listed above to help those who have accessibility issues. The content will have user relevance on each page, so the users don't have to worry about losing interest. Finally, a Review Stage, which will consist of user acceptance, testing and the positives/negatives and what could I have done even better to improve my interface to a better standard.

I will put thought into brand colours, mood, look and feel, brand experience and choosing a nice complete colour palette for section headings and body copy.

I will use clever ways of serving up content like using categories and tabs, I will use lazy load techniques meaning content will only load when you come into that section this make your site lightweight and load very quickly.

Input Requirements:

As the users will be able to input data or commands, through online on our official cosy pet's website or in store, they can experience this all devices so people can use it on their most comfortable device. And if people who have a disability, we have tools provided to help you with booking your pets online on our website. An example of using this interface is by computer or a laptop which will be accessible as it is provided with a keyboard and a mouse. Plus, on a positive note, this will make the user interface easier for all users to allow them to interact across multiple channels. Lastly, we have a pre-order system where users can access anywhere no matter where they are. This will also be visually displayed on our website, and the order you have purchased will go straight to us at cosy pets.

Output Requirements:

This interface will contain all the needs which will include visual output (what the users see such as screen, text), audio output (sound that users hear) and lastly, haptic output (feedback that users feel). For example, haptic output, this interface is designed to provide feedback through a built-in vibration or forces to provide feedback to us to make cosy pets a better place. Another example is visual output which will basically read out the text you

have chosen so people can hear about us in cosy pets and most importantly, the facilities that your pet is going to be provided with.

User accessibility requirements

As for people who has individual needs, we have created a feature for those who need it most, they can even click on which option to select whatever feature they need so they can experience a trouble-free interface and so the navigation will be at ease for the users as well. Also, there will be loads of options to choose from and if for some reason you can't find the feature you're looking for, ask us, we will sort it and get it into our system immediately for you within hours to make sure you feel comfortable at cosy pets.

Visual Needs

People with low vision do not need to worry about a thing as I will cope with the website with some special tools. For example, one feature is that we will have on the side a magnifying glass so that we can help the users as much as possible as it will zoom in and out for our users to make them feel pleasant and comfortable. I will also enlarge the magnifier glass icon to a standard so they can see the icon because if they can't see the icon there's no point of them using it and as a result, might complain and get frustrated.

Hearing Needs

As for people who have a loss in hearing, I have provided special audio that will have clearer communication (appropriate speaking volume and the pace), reduced background noise (keeping the background noise as quiet as possible), and the use of assistant technology (needing professional support). With all this we can make sure the users will have a great time with our interface. Lastly, I have created an accessible feature called "text to speech", which basically is to help them to use and acknowledge the interface so that they can experience the interface properly rather than having a bad time, and to a further extent, will read out the text for important information they need to know.

Speech Needs

As for speech needs, I have place aids for those who are struggling with my interface especially speech needs. Some examples of the features I have put in place are Expressive language (having short simple sentences) and Receptive language (following multi-step instructions, understanding grammar). This will help our users to go beyond our exaptation's.

Motor Needs

As for motor needs, we will ensure that users can interact effectively by putting in-place tools like, simple inputs, keyboard navigation and enlarging clickable areas. This will also help me a lot as these 3 tools are required for a sustainable interface. Lastly, when text is published out to the user, we will include some pictures depending on what they are looking for, so they can pick out the stuff that is important to them.

Cognitive Needs

From start to finish, my interface will include a lot of clear and simple words and language that will promote a simple user experience and to minimize user effort or to promote ease of use. Also, the users will be assisted as the details will meet your requirements. Another point is that people who are colourblind will be aided as a feature called “colour change” will change the colour if you are finding it difficult to point out some colours. This has been put in place so users can switch between different formatting or display rules so they can do what is best for them to make them feel comfortable. Furthermore, I need systems to have a clean uncluttered interface to help me maintain focus on key information. I will ensure the website is clear form error messages bugs and pages failing to load, rather than just stating an error code 404. Lastly, for language and communication, I need communication to be in plain language, avoiding jargon or excessively technical terms, providing written instructions to help the users understand and follow tasks more accurately. A website is and extension of a brand experience.

Constraints

Time:

For my project, the time has been confirmed to be a total of 9 weeks. Within this period, I must make sure that additional tasks are completed, for example if people are frustrated or annoyed with my interface, I will have to take some time out to upgrade it or improve it to a better standard. This is why I will do the mostly important tasks first then escorted by the smaller tasks at the end. This will help me a lot as it demonstrates a strategic understanding of project management.

Budget:

For my full interface, the budget has been confirmed to be a total of £8,500. I must ensure that I use this money wisely and properly for my resources and tools and that it does not go over the limit of my client's budget. So, for that reason, I have decided to use the money on creating interactive displays so that users can effectively use them around cosy pets. As for skilled employees, software and hardware, we have the right people, but were stretched thin, we need more hands to keep up with our current campaigns. Lastly, as me and my team move forward, we will start getting into AI-assisted development so we can use this advantage for specific training in those areas to help us transition faster.

Task Dependencies

All around my interface, I must ensure that I complete previous tasks before testing on to the next one so that no faults can occur when the users try to test it. For example, I will perform a discovery session with the client to identify the user requirements and establish the visual identity and brand guidelines for the interface. The idea of this is so align on the information architecture and gather assets such as high-resolution imagery, for the initial mock-ups. We will then hold an initial design consultation to translate the client's brief into technicals requisites and low-fidelity wireframes. This will help me a lot as it will prevent future errors, therefore, the completion of my interface will be to the highest quality.

Security:

Finally, security is vitally important as it has many advantages like reducing the risk of harm and potentially violence with regards to our customers, plus, installing a strong security system to the interface will prevent any information being exploited. Also, this will compromise of basic identifiers like Name, address, email address, phone number, date of birth and identification number (e.g. natural insurance number) so the user interface can have regular checks with the customers and keeping their personal details private, prioritizing user safety through an ideal and secure interface.
