

User interface review

User requirements

The user requirements engage me to design an entertaining and pleasant experience for my users to explore my interface. Also, it can help me by attaining whatever the users fancy by requesting of what they want to help my interface improve to a better standard. Lastly, I will put in this user requirements to my online Information Point for a well admired company of “Cosy Pets”.

Ease of use

There are several ways in which I have met the user requirements under my interface for “Cosy Pets”, it is also essential that my interface is crystal clear and simple for the users to interact with my interface. Therefore, I have ensured that my interface has a limiting amount of information so that it does not overload the interface and not to put my users in a tight situation. The main purpose of this is to create a sustainable interface for users to interact with. This vital requirement will help users to not overload their

brain with information and to limit the amount of information on each page in my interface.

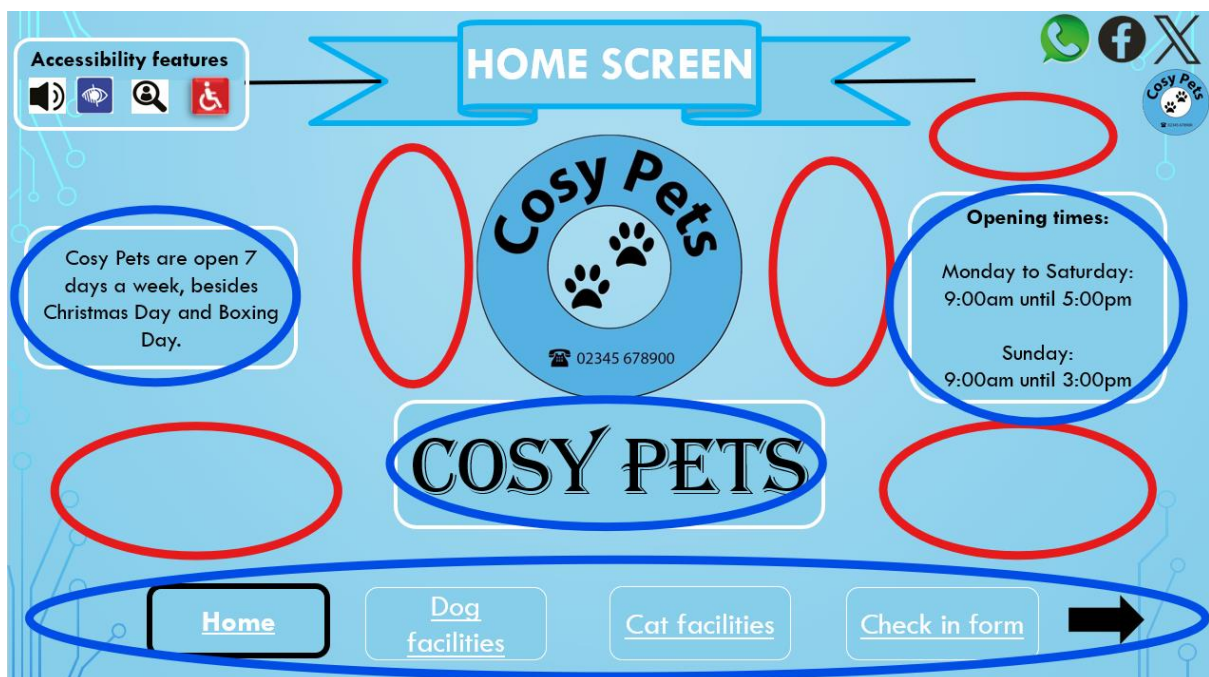

Secondly, another way I have fulfilled the user requirements is that I have made a clear use of navigation, meaning that I have made it clear which page they are currently on by highlighting in bold the page they are on. This feature is to stop any confusion for the users and to make it as simple as possible for them to fully understand the structure of the interface. Also, I have placed in another key navigation tool which will help the users to go to the previous or next page. These “previous” and “next” arrows will be in place to again stop any misunderstanding and confusion with the users and to give them a comfortable environment to experience our interface.

Design principles used

Design principles are put in place to keep an attractive but also a great quality interface. It will also gain attention while at the same time, will be an enjoyable interface to dive into.

A prime example of these design principles is whitespace. Whitespace is essentially useful as it is vital to have because we do not want to overload the users with a bunch of information. On the other hand, not overloading the users with information will give them a good sensation to our interface. Below an image is located presenting the use of whitespace on the page “Home” in my interface. The annotations are presenting whitespaces (in red) and the information guide (in blue).

Moving forward, I have used necessary colours of white and black as you can see in the image above. The

idea of this is to avoid clashing as users will go through a lifetime of hardships trying to read this. It also gives it a unique look to the interface, as well to retain user attention.

Additionally, my interface has included many uses of accessibility features which is featured at the top left corner of my interface for all slides. One accessibility feature I have included in my interface is text-to-speech. This allows users (if they are finding the text difficult) to click this icon and will automatically read out the text from what is interpreted on the page. Another useful feature I have included in my interface is a magnifier glass, this helps users (when reading the text) to zoom in and out anywhere on the interface, whether looking at the images or the text it is all provided to the users. These accessibility features have been put in place to make the interface more outstanding and get that professional kick to the interface, so users can experience and enjoyable interface.

Accessibility features.

Accessibility features are vital to an interface to assist our users with an enjoyable and entertaining interface. My interface consists of multiple accessibility features which will guide the users on the right track to understanding our interface. Underneath this will show a list of accessibility features I have considered and included within my interface:

- Text-To-Speech (reads out information)
- Zoom in/out (magnifier glass)
- Visual conditions

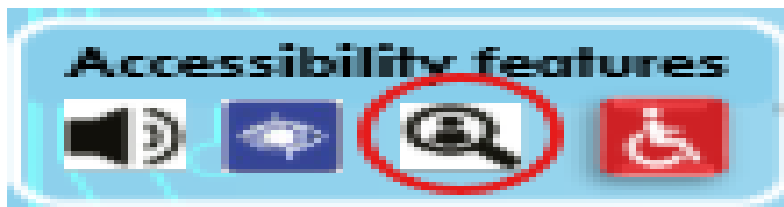

Text-To-Speech

Text-To-Speech are there to prevent people from struggling if they can't read a word/phrase (due to visual impairments) and will aid those as this feature reads out the text so loud enough so they can hear it.

This feature is there only for people with poor vision; this will give them comfortable feeling to the interface as they can now experience what has been said within my interface.

Zoom in/out (magnifier glass)

This zoom in/out option is there to help people cannot specifically see things crystal clear due to poor vision and just people having struggles reading information. However, clicking this accessibility feature will help users alternate the magnification size of the specific page they are currently on. Adding on to my point, whenever users want to click on a specific info-point, it will automatically zoom in on what you want to know. This will help the users a lot as they can experience joy and happiness throughout the interface.

Visual conditions

This accessibility feature helps users to adjust their visual feature such as the brightness scheme or the colour correction (changes the colour). This feature is useful to users as it can change the colour background to what they desire to make them comfortable and effectively use the interface to their max. Changing the colour, background etc can be reversed meaning that it can go back to normal if you have mistaken a colour.

Suggest improvements that could be made to the user interface to better meet the audience needs.

Weaknesses and Improvements

Throughout my strengths of my interface, I have some improvements to the interface to be announced.

One important weakness is that I haven't got enough accessibility features within my interface. For instance, one accessibility feature I haven't included in my interface is 'language changer'. While having some accessibility features in my interface, this language changer is vital as most people will experience this interface worldwide meaning some people might not talk or have little clue of know English. Therefore, one improvement is that next time Cosy Pets will have a wide range of accessibility features to help improve the interface, to give our users a stress-free experience.

Another important weakness I haven't got is that I am lacking on slides, while 4 slides is the minimum to an interface, I could have an additional slide about customers feedback and our background profile and what we do for a living (what we do for work and our plans). Also, I could have added more information about Dog/Cat facilities, to make sure that our users

are on board with what we are saying, or to make them understand more about our sayings. To make sure our users are fully on board with us, my next improvement will be to add an additional slide to help users understand more about us and our career, ensuring that all users experience joy and happiness.
